FB HackerCup 2017-0: Fighting the Zombies

"Okay, Wizard, cast your spell!"

But which of your many spells to cast? In the ever-popular role-playing game Dungeons & Dragons, or D&D, you determine a spell's damage by rolling polyhedral dice with 4, 6, 8, 10, 12, or 20 sides. Since there's a lot of dice-rolling involved, players use shorthand to denote which dice should be rolled. `XdY` means "roll a Y-sided die X times, and sum the rolls. Sometimes, you must add or subtract a value Z after you finish rolling, in which case the notation is `XdY+Z` or `XdY-Z` respectively.

For example, if you roll `2d4+1`, you'll end up with a result between 3 and 9 inclusive. If you roll `1d6-3`, your result will be between -2 and 3 inclusive.

In D&D, wizards are powerful but flimsy spellcasters. As a wizard fighting a zombie, your best strategy is to maximize the chance that you can kill the zombie with a single spell before it has a chance to retaliate. What spell should you cast?

Input Format

Input begins with an integer T, the number of zombies you'll fight. For each zombie, there are two lines. The first contains two integers, H and S, the minimum amount of damage it takes to defeat the zombie, and the number of spells you have prepared, respectively. The second line contains S spell descriptions separated by single spaces. A spell description is simply the amount of damage a spell does in the notation described above.

Constraints

$1 \leq T \leq 1{,}000$

$1 \leq H \leq 10{,}000$

$2 \leq S \leq 10$

Additionally, the following constraints will hold for each spell:

$1 \leq X \leq 20$

$Y \in \{4, 6, 8, 10, 12, 20\}$

$1 \leq Z \leq 10{,}000$, if Z is specified.

X, Y, and Z will be integers with no leading zeros.

Output Format

For each zombie, print a line containing the probability of defeating the zombie if you select your spell optimally.

Absolute and relative errors of up to 1e-6 will be ignored.

Note: In order to use the HackerRank error tolerance feature, the output has been changed from the original problem in the FB competition. You should include only the number to be output, without the "Case #i: " at the beginning of the line.

Sample Input 0

```
5
2 2
2d4 1d8
10 2
10d6-10 1d6+1
8 3
1d4+4 2d4 3d4-4
40 3
10d4 5d8 2d20
10 4
1d10 1d10+1 1d10+2 1d10+3
```

Sample Output 0

```
1.000000
0.998520
0.250000
0.002500
0.400000
```

Explanation 0

In the first case, you can guarantee a kill with the first spell, which must always do at least 2 damage.

In the third case, your first spell is the best. If you roll a 4, you'll do the requisite 8 damage. The second spell requires rolling a 4 on two dice rather than just one, and the third spell requires rolling a 4 on all three dice.
